

FOUNDATIONS OF UX AND UI DESIGN

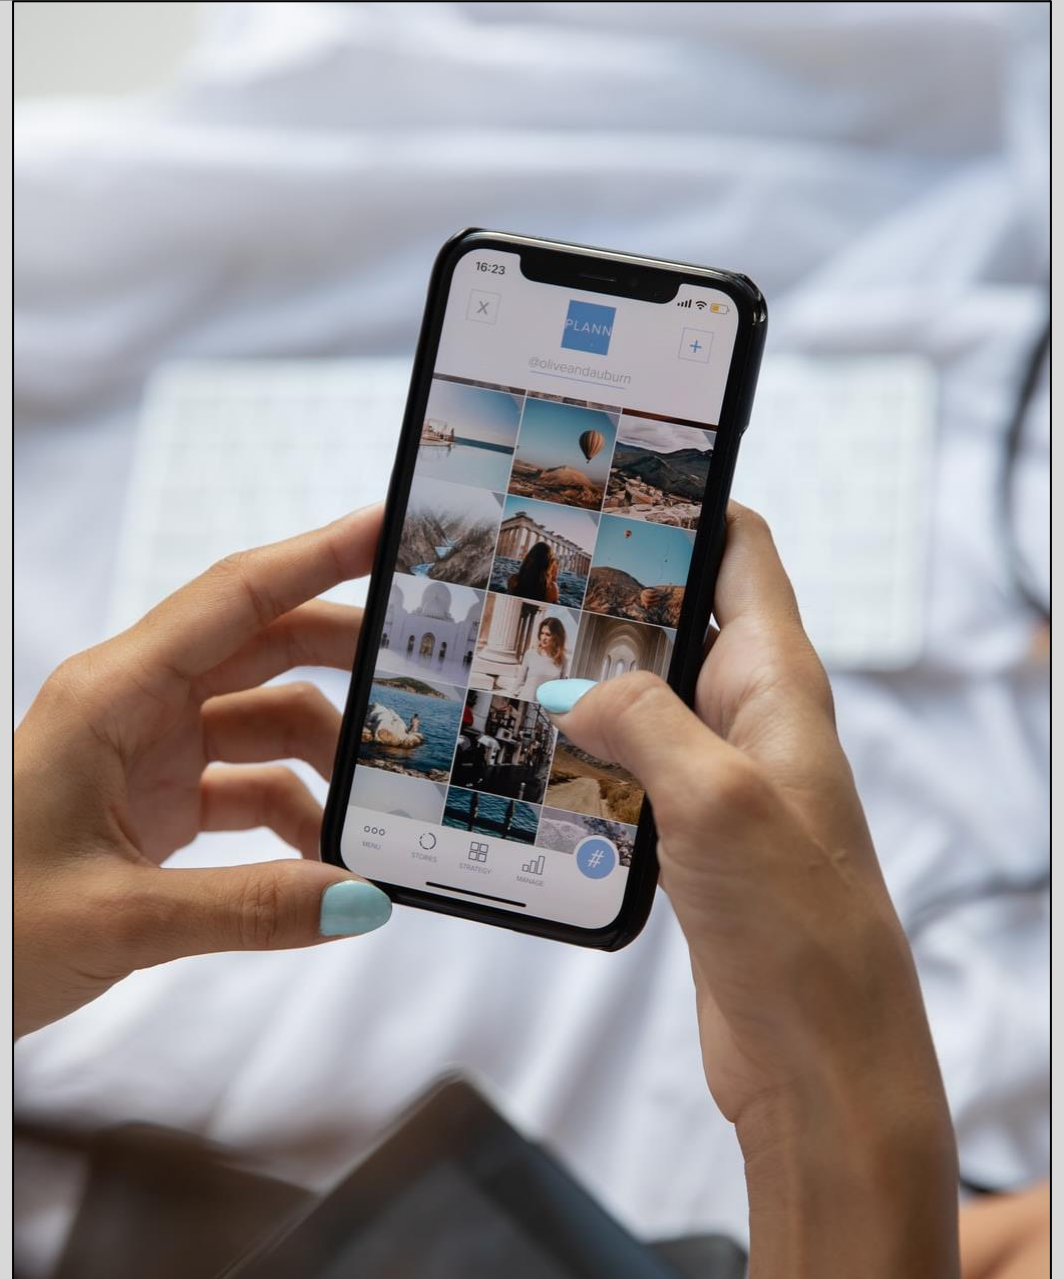

Maria Laar

What is User Experience?

User Experience

How a person, the user, feels about interacting with or experiencing a product (a service or feature).

Was it easy to navigate? Did you ever feel lost or confused? How did you know where to click to get to where you needed to go?

QUIZ

For a user to have a good experience, the product needs to be..?

For a user to have a good experience, the product needs to be:

- **Usable**
 - Easy to use, design, structure and purpose clear to everyone
- **Equitable**
 - Suitable for people with diverse abilities and backgrounds
- **Enjoyable**
 - Create a positive connection b/w user and product, take feelings and thoughts into consideration
- **Useful**
 - Solves a problem

A product with good **usability**
creates **promoters.**

UX vs UI Design

- **“User experience design (UX)”** is often used interchangeably with **“User interface design (UI)”** or **“Usability”**
- Both UI and Usability are important aspects of UX design, yet UX covers a wide range of other areas.

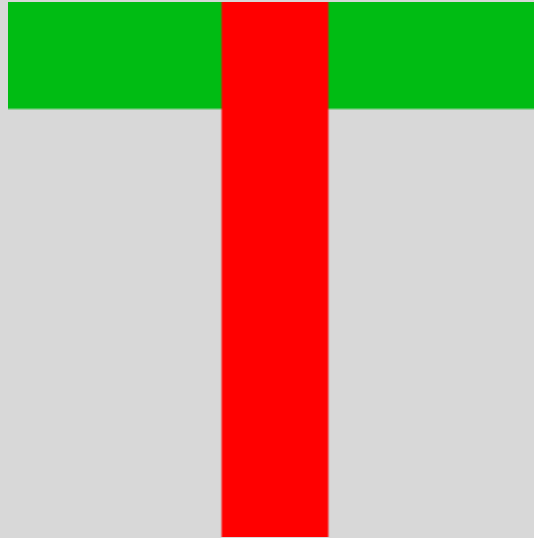

Areas of UX Design

- User Experience Research (pre-design stage)
- User Interface Design (UI)
- UX Architect / Information Architect (organization of content)
- UX Copywriter
- UX Interaction Designer
- Visual Designer
- Graphic Designer
- UX Analyst (post-design stage)

Gestalt Design Principles

Gestalt Principles are principles/laws of human perception that describe how humans group similar elements, recognize patterns and simplify complex images when we perceive objects. Designers use the principles to organize content on websites and other interfaces so it is aesthetically pleasing and easy to understand.

- A set of laws which address the natural compulsion to find order in disorder. According to this, **the mind “informs” what the eye sees by perceiving a series of individual elements as a whole.** There are over 10 laws, the five most popular are:
 - Law of Proximity
 - Law of Similarity
 - Law of Continuity
 - Law of Closure
 - Focal Point

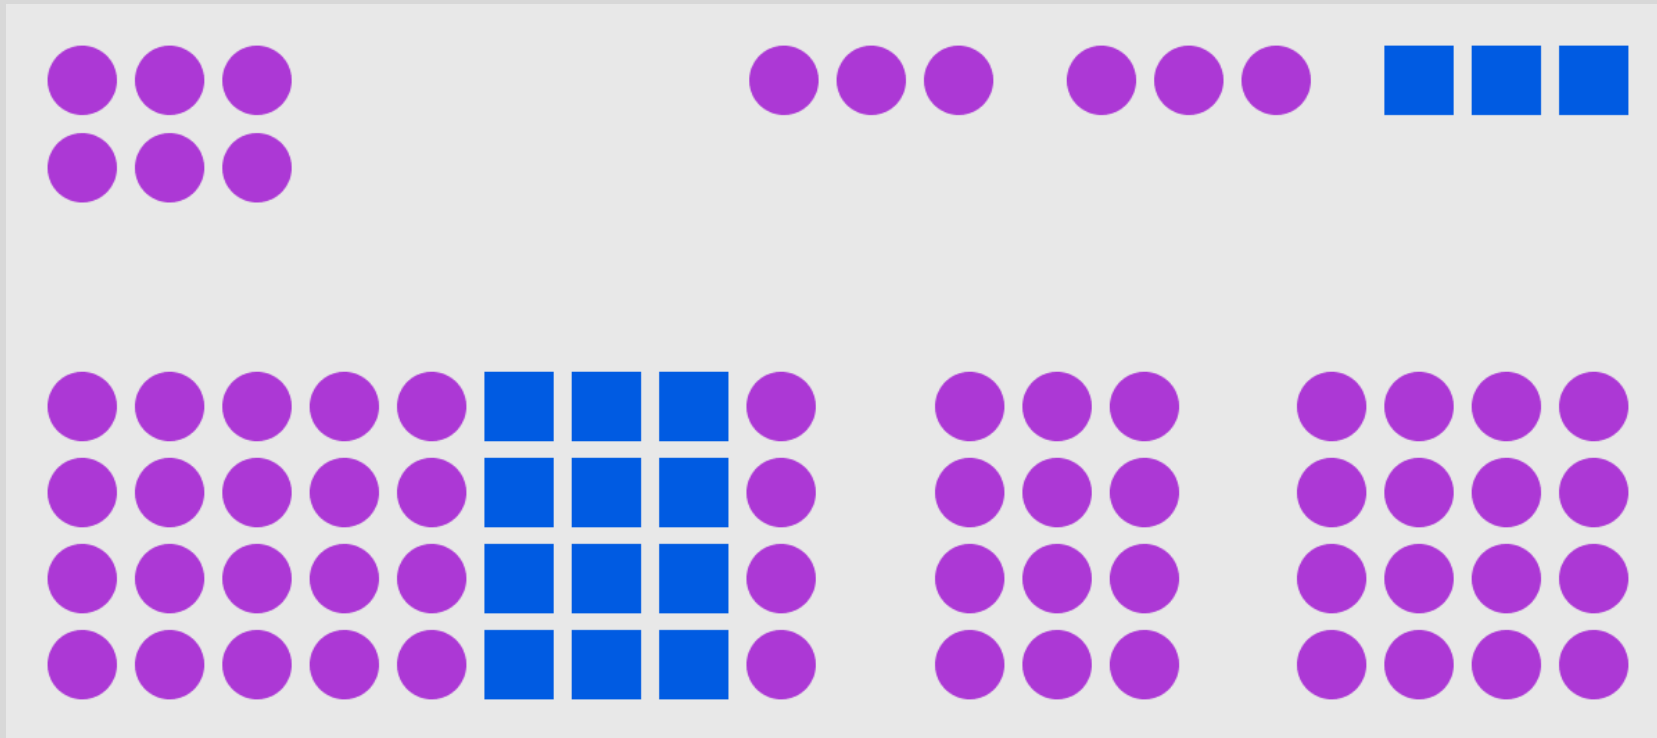

Law of Proximity

Objects that are placed near each other in space or time are perceived as belonging together, a group.

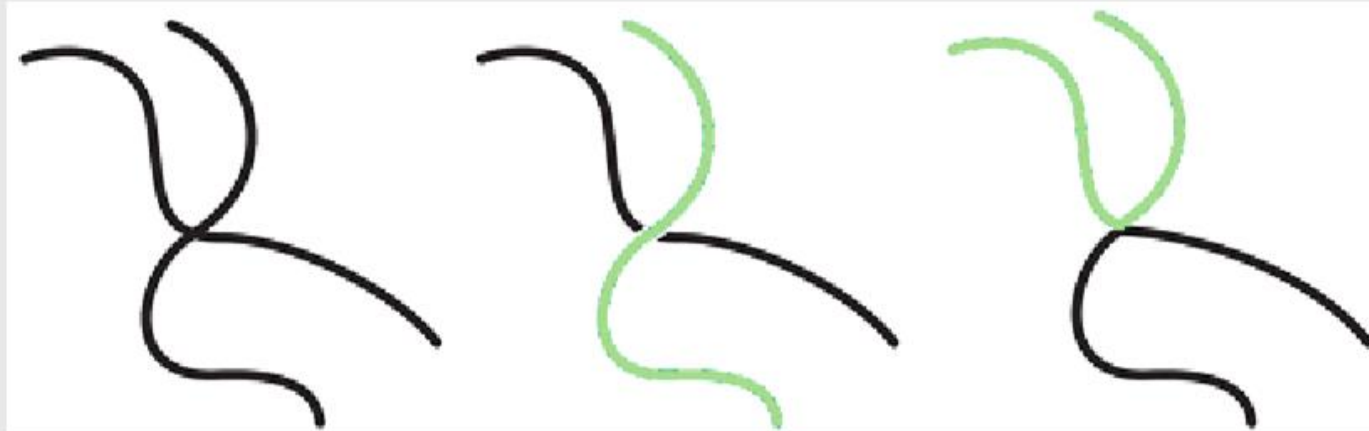

Law of Similarity

When things appear to be **similar** to each other, we group them together. And we also tend to think they have the same function.

Law of Continuity

The human eye follows lines, curves, or a sequence of shapes in order to determine a relationship between design elements. When elements move in the same direction, they are perceived to be more related than elements that don't move or that move in different directions or at different speeds.

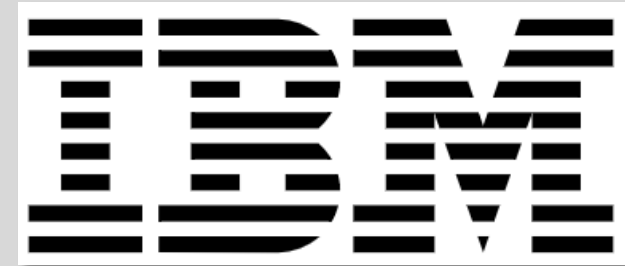

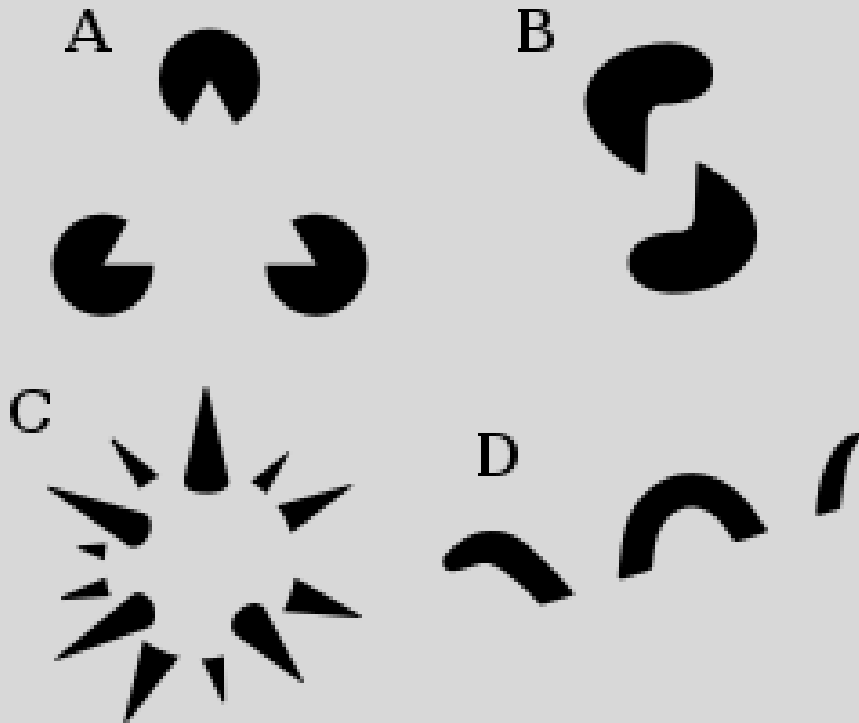

This is perceived as...

this,

and not this.

Law of Closure

We prefer complete shapes, so we automatically fill in gaps between elements to perceive a complete image. That's how we can see the whole first.

Focal Point

Whatever stands out visually will capture and hold the viewer's attention first. This is usually used to draw attention to a call-to-action element, something **you** want the user to see or action.
